# gbif.range

November 2, 2022

140Vember 2, 2022
Type Package
<b>Title</b> A toolbox to efficiently download and filter large GBIF observational datasets for sound spatial analyses
Version 0.2.0
<b>Depends</b> R (>= 4.0.0), raster, terra, rgbif, CoordinateCleaner, rgeos, mclust, ClusterR, FNN, geometry
<b>Description</b> Workflow to generate taxa range maps from scratch based on ecoregions and an user-friendly GBIF wrapper (no hard-limit of < 100,000 species observations, filetring parameters to easily flag records, access to the GBIF backbone taxonomy)
License GPL (>=3)
BugReports https://github.com/8Ginette8/gbif.range/issues
Encoding UTF-8
Maintainer Yohann Chauvier <yohann.chauvier@wsl.ch></yohann.chauvier@wsl.ch>

Index 12

conv\_function

Create polygon objects in different bioregions

#### **Description**

Not to be called directly by the user

## Usage

```
conv_function(sp_coord, bwp, bipl, bwpo, temp_dir, g = NULL)
```

get\_doi

Get a custom DOI for a GBIF filtered dataset

### **Description**

A small user friendly wrapper of the derived\_dataset() function of the rgbif R package, compatible with one or several  $get\_gbif()$  outputs.

# Usage

```
get_doi(
  get.gbif = NULL,
  title = NULL,
  description = NULL,
  source_url = "https://example.com/",
  user = "",
  pwd = "",
  ...
)
```

## **Arguments**

```
get.gbif data.frame or list. One get_gbif() output or a list of several.

title The title for your derived dataset.

source_url A link to where the dataset is stored.

user Your GBIF username.

pwd Your GBIF password.

... Additonnal parameters for derived_dataset() in rgbif.

descritpion A description of the dataset.
```

get\_gbif 3

#### **Details**

see derived\_dataset() function from the rgbif R package

#### Value

One citable DOI and its information.

#### References

Chamberlain, S., Oldoni, D., & Waller, J. (2022). rgbif: interface to the global biodiversity information facility API. 10.5281/zenodo.6023735

#### See Also

The rgbif package for additional and more general approaches to get GBIF DOI

#### **Examples**

get\_gbif

Massively download and filter GBIF observations for sound spatial analyses

## **Description**

Implement an user-friendly workflow to download and clean gbif taxa observations. The function uses the rgbif R package but (1) implements the same search result found if www.gbif.org is employed i.e., based on the input taxa name, all species records related to its accepted name and synonyms are extracted. The function also (2) bypasses rgbif hard limit on the number of records (100'000 max). For this purpose, a dynamic moving window is created and used across the geographic extent defined by the user. This window automatically fragments the specified study area in succesive tiles of different sizes, until all tiles include < 100'000 observations. The function also (3) automatically applies a post-filtering of observations based on the chosen resolution of the study/analysis and by partly employing the CoordinateCleaner R package. Filtering options may be chosen and involve several choices: study's extent, removal of duplicates, removal of absences, basis of records selection, removal of invalid/uncertain xy coordinates (WGS84), time period selection and removal of raster centroids. By default, the argument hasGeospatialIssue in occ\_search() (implemented rgbif function) is set to FALSE.

4 get\_gbif

#### **Usage**

```
get_gbif(
  sp_name = NULL,
  conf_match = 90,
  geo = NULL,
 grain = 1000,
  duplicates = FALSE,
  absences = FALSE,
 no_xy = FALSE,
  basis = c("OBSERVATION", "HUMAN_OBSERVATION", "MACHINE_OBSERVATION",
  "MATERIAL_SAMPLE", "PRESERVED_SPECIMEN", "FOSSIL_SPECIMEN", "LIVING_SPECIMEN",
    "LITERATURE", "UNKNOWN"),
  add_infos = NULL,
  time_period = c(1000, 3000),
  identic_xy = FALSE,
 wConverted_xy = FALSE,
  centroids = FALSE,
 ntries = 10,
  error.skip = TRUE,
)
```

#### **Arguments**

sp\_name Character. Scientific name to run an online search (i.e. with GBIF-API) for

species observations. Works also for genus and higher taxa levels.

conf\_match Numeric from 0 to 100. Determine the confidence threshold of match of 'sp\_name'

with the GBIF backbone taxonomy. Default is 90.

geo Object of class Extent, SpatExtent, SpatialPolygon, SpatialPolygonDataframe,

or SpaVector (WGS84) to define the study's area extent. Default is NULL i.e.

the whole globe.

grain Numeric. Specify in meters the study resolution. Used to filter gbif records (x2)

according to their uncertainties and number of coordinate decimals. Records with no information on coordinate uncertainties (column 'coordinateUncertain-

tyInMeters') are be kept by default. See details.

duplicates Logical. Should duplicated records be kept?

absences Logical. Should absence records be kept?

no\_xy Logical. Default is FALSE i.e. only records with coordinates are downloaded.

If TRUE, only records with no coordinates are downloaded.

basis Character. Which basis of records should be selected? Default is all i.e. c('OBSERVATION',

'HUMAN\_OBSERVATION', 'MACHINE\_OBSERVATION', 'MATERIAL\_SAMPLE',

'PRESERVED\_SPECIMEN', 'FOSSIL\_SPECIMEN', 'LIVING\_SPECIMEN',

'LITERATURE', 'UNKNOWN'). Description may be found here: https://docs.gbif.org/course-

data-use/en/basis-of-record.html

add\_infos Character. Infos that may be added to the default output information. List

of IDs may be found at: https://www.gbif.org/developer/occurrence. Default IDs contain 'taxonKey', 'scientificName', 'acceptedTaxonKey', 'acceptedScientificName', 'individualCount', 'decimalLatitude', 'decimalLongitude', 'basisOfRecord', 'coordinateUncertaintyInMeters', 'country', 'year', 'datasetKey', 'institutionCode', 'publishingOrgKey', 'taxonomicStatus' and 'taxonRank'.

get\_gbif 5

year range. Default is c(1000,3000). Observations with year = NA are kept by

default.

identic\_xy Logical. Should records with identical xy be kept?

wConverted\_xy Logical. Should incorrectly lon/lat converted xy be kept? Uses cd\_ddmm() from

'CoordinateCleaner' R package.

centroids Logical. Should species records from raster centroids be kept? Uses cd\_round()

from 'CoordinateCleaner' R package.

ntries Numeric. In case of failure from GBIF server or within the rgbif package, how

many download attempts should the function request? Default is '10' with a 2 seconds interval between tries. If attempts failed, an empty data.frame is return

by default.

error.skip Logical. Should the search process continues if ntries failed?

... Additional parameters for the function cd\_round() of CoordinateCleaner.

#### **Details**

Argument 'grain' used for two distinct gbif records filtering. (1) Records filtering according to gbif 'coordinateUncertaintyInMeters'; every records uncertainty > grain/2 are removed. Note: Records with no information on coordinate uncertainties are kept by default. (2) Records filtering according to the number of longitude/latitude decimals; if 110km < grain <= 11km, lon/lat with >= 1 decimal are kept, if 11km < grain <= 1100m, lon/lat with >= 2 decimals kept; if 1100m < grain <= 110m, lon/lat with >= 4 decimals are kept; if 11m < grain <= 1.1m, lon/lat with >= 5 decimals are kept etc...

## Value

Object of class data.frame with requested GBIF information. Although the function works accurately, error outputs might still occur depending on the 'sp\_name' used. Therefore, default information detailed in 'add\_infos' is stored so that sanity checks may still be applied afterwards. Although crucial preliminary checks of species records are done by the function, additional post exploration with the CoordinateCleaner R package is still highly recommended.

6 get\_range

#### **Examples**

```
# Load maptools for the map world
library(maptools)
data(wrld_simpl)
# Load the Alps Extend
data(geo_dat)
# Downloading worldwide the observations of Panthera tigris
obs.pt = get_gbif("Panthera tigris",basis=c("OBSERVATION","HUMAN_OBSERVATION"))
plot(wrld_simpl)
points(obs.pt[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=4)
# Downloading in the Alps the observations of Cypripedium calceolus (with a 100m grain and
# by adding the 'issues' column)
obs.cc = get_gbif("Cypripedium calceolus", geo = shp.lonlat, grain = 100, add_infos = c("issue"))
plot(shp.lonlat)
points(obs.cc[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=1)
# Downloading worlwide the observations of Ailuropoda melanoleuca (with a 100km grain, after 1990
# and by keeping duplicates and by adding the name of the person who collected the panda records)
obs.am = get_gbif("Ailuropoda melanoleuca", grain = 100000 , duplicates = TRUE,
    time_period = c(1990,3000), add_infos = c("recordedBy","issue"))
plot(wrld_simpl)
points (obs.am[,c("decimalLongitude","decimalLatitude")], pch=20,col="#238b4550",cex=4) \\
# Downloading worlwide the observations of Phascolarctos cinereus (with a 1km grain, after 1980,
# and keeping raster centroids)
obs.pc = get_gbif("Phascolarctos cinereus", grain = 1000,
    time\_period = c(1990,3000), centroids = TRUE)
```

get\_range

Create a species range map based on a get\_gbif() output

# **Description**

Estimates species ranges based on occurrence data (GBIF or not) and bioregions. It first deletes outliers from the observation dataset and then creates a polygon (convex hull) with a user specified buffer around all the observations of one bioregion. If there is only one observation in a bioregion, a buffer around this point will be created. If all points in a bioregion are on a line, the function will also create a buffer around these points, however, the buffer size increases with the number of points in the line.

#### Usage

```
get_range(
  sp_name = NULL,
  occ_coord = NULL,
  Bioreg = eco.earth,
  Bioreg_name = "ECO_NAME",
  degrees_outlier = 3,
```

get\_range 7

```
clustered_points_outlier = 2,
buffer_width_point = 4,
buffer_increment_point_line = 0.5,
buffer_width_polygon = 4,
dir_temp = paste0("temp", sample(1:99999999, 1)),
raster = TRUE,
res = 10
)
```

#### **Arguments**

sp\_name Character of the species name. E.g. 'Anemone nemorosa'.

occ\_coord get\_gbif() output or SpatialPoints object.

Bioreg SpatialPolygonsDataFrame containg different bioregions (convex hulls will be

classified on a bioreg basis). Although whatever shapefile may be set as input, note that three ecoregion shapefiles are already included in the library: eco.earh' (for terrestrial species; Nature conservancy version adapted from Olson & al. 2001), eco.marine' (for coastal and reef species; Spalding & al. 2007) and 'eco.fresh' (for freshwater species; Abell & al. 2008). For deep ocean/sea species, 'eco.earth' may be used, but the polygon estimates will only be geo-

graphic. Default is 'eco.earth'.

Bioreg\_name How is the slot containing the bioregion names called? Default is the very de-

tailed level of 'eco.earth' or "ECO\_NAME".

degrees\_outlier

distance threshold (degrees) for outlier classification. If the nearest minimal distance to the next point is larger than this threshold, it will be considered as an

outlier.

clustered\_points\_outlier

maximum number of points which are closer to each other than the degrees\_outlier, but should still be considered as outliers.

buffer\_width\_point

buffer (in degrees) which will be applied around single observations.

buffer\_increment\_point\_line

how much should the buffer be increased for each point on a line.

buffer\_width\_polygon

buffer (in degrees) which will be applied around distribution polygons (for each

bioregion).

dir\_temp where should the temporary text file for the convex hull be saved? (text file will

be deleted again).

raster Logical. Should the output be a unified raster? Default is TRUE

res Numeric. If raster = TRUE, which resolution? Final resolution in  $^{\circ}$  = 1 $^{\circ}$ /res e.g.,

=  $0.1^{\circ}$  if res = 10. Default is 10.

## **Details**

...

# Value

A Shapefile or a SpatRaster

8 get\_range

plot(range.tiger,col="#238b45",add=TRUE)
```

get\_taxonomy 9

get_taxonomy	Retrieve from GBIF all scientific names of a specific Taxa

# Description

Generates, based on a given species name, a list of all its scientific names (accepted, synonyms) found in the GBIF backbone taxonomy to download the data. Children and related doubtful names not use to download the data may also be extracted.

# Usage

```
get_taxonomy(sp_name = NULL, conf_match = 90, all = FALSE)
```

## **Arguments**

sp_name	Character. Species name from which the user wants to retrieve all existing GBIF names
conf_match	Numeric. From 0 to 100. Determine the confidence threshold of match of 'sp_name' with the GBIF backbone taxonomy. Default is 90.
all	Logical. Default is FALSE. Should all species names be retrieved or only the accepted name and its synonyms?

### Value

A data.frame with two columns: (1) Names and (2) Backbone Taxonomy Status

#### References

Chamberlain, S., Oldoni, D., & Waller, J. (2022). rgbif: interface to the global biodiversity information facility API. 10.5281/zenodo.6023735

## See Also

```
get_taxonomy("Cypripedium calceolus",all=FALSE)
get_taxonomy("Cypripedium calceolus",all=TRUE)
```

10 make\_tiles

make_tiles	Create a specific number of tiles based on a raster extent	

# Description

Based on a specific extent, one or several tiles are generated. Tiles can be smaller raster extents or geometry arguments POLYGON(). The original extent is therefore either converted into a POLYGON() argument, or divided into Ntiles of regular fragments which are converted into POLYGON() arguments and smaller SpatExtent.

# Usage

```
make_tiles(geo, Ntiles, sext = TRUE)
```

# **Arguments**

geo	Object of class Extent, SpatExtent, SpatialPolygon, SpatialPolygonDataframe, or SpaVector (WGS84 or planar) to define the study's area extent. Default is NULL i.e. the whole globe.
Ntiles	Numeric. In how many tiles/fragments should geo be divided approximately?
sext	Logical. Should a list of SpatExtent also be returned for each generated POLYGON()?

#### Value

A list of geometry arguments POLYGON() of length Ntiles (and of SpatExtent if sext=TRUE)

## References

Chauvier, Y., Thuiller, W., Brun, P., Lavergne, S., Descombes, P., Karger, D. N., ... & Zimmermann, N. E. (2021). Influence of climate, soil, and land cover on plant species distribution in the European Alps. Ecological monographs, 91(2), e01433. 10.1002/ecm.1433

```
# Load the European Alps Extent
data(geo_dat)

# Apply the function to divide the extent in ~20 fragments
mt = make_tiles(geo=shp.lonlat,Ntiles=20,sext=TRUE); mt
```

obs\_filter 11

obs\_filter

Filter a set of GBIF observations according to a defined grain

## **Description**

Whereas the 'grain' parameter in get\_gbif() allows GBIF observations to be filtered according to a certain spatial precision, obs\_filter() accepts as input a get\_gbif() output (one or several species) and filter the observations according to a specific given grid resolution (one observation per pixel grid kept). This function allows the user to refine the density of GBIF observations according to a defined analysis/study's resolution.

#### Usage

```
obs_filter(get.gbif, grid)
```

#### Arguments

get.gbif one get\_gbif() output including one or several species. Note that if GBIF ab-

sences are kept in the output(s), the function should be used distinctively for

observations and absences.

grid Object of class SpatRaster, RasterLayer, RasterBrick or RasterStack of desired

resolution and extent (WGS84)

#### Value

a data frame with two columns named 'x' and 'y' comprising the new set of observations filtered at grid resolution.

```
# Load the European Alps extent and a raster of a random resolution
data(geo_dat)
data(exrst)
# Downloading in the European Alps the observations of two plant species
obs.arcto = get_gbif("Arctostaphylos alpinus",geo=shp.lonlat)
obs.saxi = get_gbif("Saxifraga cernua",geo=shp.lonlat)
plot(vect(shp.lonlat))
points(obs.arcto[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=1)
points(obs.saxi[,c("decimalLongitude","decimalLatitude")],pch=20,col="#99000d50",cex=1)
# rbind both datasets
both.sp = rbind(obs.arcto,obs.saxi)
# Run function
obs.filt = obs_filter(both.sp,rst)
# Check new points
x11();plot(vect(shp.lonlat))
points(obs.filt[obs.filt$Species%in%"Arctostaphylos alpinus",c("x","y")],pch=20,col="#238b4550",cex=1)
points(obs.filt[obs.filt$Species%in%"Saxifraga cernua",c("x","y")],pch=20,col="#99000d50",cex=1)
```
