Package 'gbif.range'

March 12, 2024

Version 1.0

Title A toolbox to generate species range maps based on ecoregions and a user-friendly GBIF wrapper

Depends R (>= 4.0.0)

Imports terra, rgbif, CoordinateCleaner, sf, ClusterR, FNN, geometry, cluster, rnaturalearth, mclust, methods

Description This package provides a workflow to generate species range maps from scratch based on ecoregions and a user-friendly GBIF wrapper. It includes functions to create taxa range maps using ecoregions and to interact with the Global Biodiversity Information Facility (GBIF) database (retrieving species records, backbone taxonomy and IUCN conservation status). The package facilitates the process of accessing GBIF data and integrating it with ecoregion information for species distribution analysis.

R topics documented:

get_doi   *Get a custom DOI for a GBIF filtered dataset*

Description

A small user friendly wrapper of the derived_dataset() function of the rgbif R package, compatible with one or several get_gbif() outputs.

Usage

```
get_doi(
  gbifs = NULL,
  title = NULL,
  description = NULL,
  source_url = "https://example.com/",
  user = "",
  pwd = "",
  ...
)
```

Arguments

gbifs	data.frame or list. One get_gbif() output or a list of several.
title	Title for your derived dataset.
description	Description of the dataset.
source_url	Link to where the dataset is stored.
user	Your GBIF username.
pwd	Your GBIF password.
...	Additonnal parameters for derived_dataset() in rgbif.

Details

see derived_dataset() function from the rgbif R package.

Value

One citable DOI and its information.

References

Chamberlain, S., Oldoni, D., & Waller, J. (2022). rgbif: interface to the global biodiversity information facility API. 10.5281/zenodo.6023735

See Also

The rgbif package for additional and more general approaches to get GBIF DOI.

Examples

```
# Download worldwide the observations of Panthera tigris and Ailuropoda melanoleuca
obs.pt <- get_gbif("Panthera tigris")
obs.am <- get_gbif("Ailuropoda melanoleuca")
## Not run:
# Retrieve DOI for only one get_gbif() output
get_doi(obs.pt,title="GBIF_test1",description="A small example 1",
  source_url="https://example.com/",user="",pwd="") # Use your own GBIF credentials here

# Retrieve DOIs for several get_gbif() outputs
get_doi(list(obs.pt,obs.am),title="GBIF_test2",description="A small example 2",
  source_url="https://example.com/",user="",pwd="") # Use your own GBIF credentials here

## End(Not run)
```

---

get_gbif	*Massively download and filter GBIF observations for sound spatial analyses*

Description

Implement an user-friendly workflow to download and clean gbif taxa observations. The function uses the rgbif R package but (1) implements the same search result found if www.gbif.org is employed i.e., based on the input taxa name, all species records related to its accepted name and synonyms are extracted. The function also (2) bypasses the rgbif hard limit on the number of records (100'000 max). For this purpose, a dynamic moving window is created and used across the geographic extent defined by the user. This window automatically fragments the specified study area in succesive tiles of different sizes, until all tiles include < 100'000 observations. The function also (3) automatically applies a post-filtering of observations based on the chosen resolution of the study/analysis and by partly employing the CoordinateCleaner R package. Filtering options may be chosen and involve several choices: study's extent, removal of duplicates, removal of absences, basis of records selection, removal of invalid/uncertain xy coordinates (WGS84), time period selection and removal of raster centroids. By default, the argument hasGeospatialIssue in occ_data() (implemented rgbif function) is set to FALSE.

Usage

```
get_gbif(
  sp_name = NULL,
  phylum = NULL,
  class = NULL,
  order = NULL,
  conf_match = 80,
  geo = NULL,
  grain = 1000,
  duplicates = FALSE,
  absences = FALSE,
  no_xy = FALSE,
 basis = c("OBSERVATION", "HUMAN_OBSERVATION", "MACHINE_OBSERVATION", "OCCURRENCE",
    "MATERIAL_CITATION", "MATERIAL_SAMPLE", "LITERATURE"),
  add_infos = NULL,
```

```
    time_period = c(1000, 3000),
    identic_xy = FALSE,
    wConverted_xy = FALSE,
    centroids = FALSE,
    ntries = 10,
    error.skip = TRUE,
    occ_samp = 99000,
    ...
)
```

Arguments

sp_name	Character. Scientific name to run an online search (i.e. with GBIF-API) to get occurrence records. Works also for genus and higher taxa levels.
phylum	Character. Optional. What the species' Phylum? Adds a criteria to deal with alternative name matches and select the right synonym. Available options are the GBIF Phylums (listed per Kingdom –> https://www.gbif.org/species/1).
class	Character. Optional. What the species' Class? Same as above but at the finer class level. Available options are the GBIF Classes (same url).
order	Character. Optional. What the species' Order? Same as above but at the finer order level. Available options are the GBIF Orders (same url).
conf_match	Numeric from 0 to 100. Determine the confidence threshold of match of 'sp_name' with the GBIF backbone taxonomy. Default is 90.
geo	Object of class Extent, SpatExtent, SpatialPolygon, SpatialPolygonDataframe, or SpatVector (WGS84) to define the study's area extent. Default is NULL i.e. the whole globe.
grain	Numeric. Specify in meters the study resolution. Used to filter gbif records according to their (1) spatial uncertainties and (2) number of coordinate decimals. Records with no information on coordinate uncertainties (column 'coordinate-UncertaintyInMeters') are be kept by default. See details.
duplicates	Logical. Should duplicated records be kept?
absences	Logical. Should absence records be kept?
no_xy	Logical. Default is FALSE i.e., only records with coordinates are downloaded. If TRUE, records with no coordinates are also downloaded.
basis	Character. Which basis of records should be selected? Available (old and new) are 'OBSERVATION', 'HUMAN_OBSERVATION', 'MACHINE_OBSERVATION', 'MATERIAL_CITATION', MATERIAL_SAMPLE', 'PRESERVED_SPECIMEN', 'FOSSIL_SPECIMEN', 'LIVING_SPECIMEN', 'LITERATURE', UNKNOWN' and 'OCCURRENCE'. Default setting removes specimens and unknown observations. Description may be found here: https://docs.gbif.org/course-data-use/en/basis-of-record.html, https://gbif.github.io/parsers/apidocs/org/gbif/api/vocabulary/BasisOfRe
add_infos	Character. Infos that may be added to the default output information. List of IDs may be found at: https://www.gbif.org/developer/occurrence. Default IDs contain 'taxonKey', 'scientificName', 'acceptedTaxonKey', 'acceptedScientificName', 'individualCount', 'decimalLatitude', 'decimalLongitude', 'basisOfRecord', 'coordinateUncertaintyInMeters', 'countryCode', 'country', 'year', 'datasetKey', 'institutionCode', 'publishingOrgKey', 'taxonomicStatus' and 'taxonRank'.

time_period	Numerical vector. Observations will be downloaded according to the chosen year range. Default is c(1000,3000). Observations with year = NA are kept by default.
identic_xy	Logical. Should records with identical xy be kept?
wConverted_xy	Logical. Should incorrectly converted lon/lat be kept? Uses cd_ddmm() from 'CoordinateCleaner' R package.
centroids	Logical. Should species records from raster centroids be kept? Uses cd_round() from 'CoordinateCleaner' R package.
ntries	Numeric. In case of failure from GBIF server or within the rgbif package, how many download attempts should the function request? Default is '10' with a 2 seconds interval between tries. If the attempts failed, an empty data.frame is return by default.
error.skip	Logical. Should the search process continues if ntries failed ?
occ_samp	Numeric. Determine how many GBIF occurrences will be sampled per geographic tiles of the fragmented study area. Default is the maximum number of GBIF observations found in a tile (i.e. ~100'000 records). A lower number may be set (<99'000) if the user only wants a sample of the species GBIF observations, hence increasing the download process and the generation of its range map if get_range() is employed afterwards.
...	Additonnal parameters for the function cd_round() of CoordinateCleaner.

Details

Argument 'grain' used for two distinct gbif records filtering. (1) Records filtering according to gbif 'coordinateUncertaintyInMeters'; every records uncertainty > grain/2 are removed. Note: Records with no information on coordinate uncertainties are kept by default. (2) Records filtering according to the number of longitude/latitude decimals; if 110km < grain <= 11km, lon/lat with >= 1 decimal are kept, if 11km < grain <= 1100m, lon/lat with >= 2 decimals kept; if 1100m < grain <= 110m, lon/lat with >= 3 decimals are kept; if 110m < grain <= 11m, lon/lat with >= 4 decimals are kept; if 11m < grain <= 1.1m, lon/lat with >= 5 decimals are kept etc...

Value

Object of class data.frame with requested GBIF information. Although the function works accurately, error outputs might still occur depending on the 'sp_name' used. Therefore, default information detailed in 'add_infos' is stored so that sanity checks may still be applied afterwards. Although crucial preliminary checks of species records are done by the function, additional post exploration with the CoordinateCleaner R package is still highly recommended.

Examples

```
# Downloading worldwide the observations of Panthera tigris
obs.pt <- get_gbif("Panthera tigris",
basis=c("OBSERVATION","HUMAN_OBSERVATION","MACHINE_OBSERVATION"))
countries <- terra::vect(rnaturalearth::ne_countries(type = "countries",returnclass = "sf"))
terra::plot(countries,col="#bcbddc")
points(obs.pt[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=4)

## Not run:

# Downloading worldwide the observations of Ailuropoda melanoleuca (with a 100km grain, after 1990
# and by keeping duplicates and by adding the name of the person who collected the panda records)
obs.am <- get_gbif("Ailuropoda melanoleuca", grain = 100000 , duplicates = TRUE,
   time_period = c(1990,3000), add_infos = c("recordedBy","issue"))
terra::plot(countries,col="#bcbddc")
graphics::points(obs.am[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=4)

# Downloading worlwide the observations of Phascolarctos cinereus (with a 1km grain, after 1980,
# and keeping raster centroids)
obs.pc <- get_gbif("Phascolarctos cinereus", grain = 1000,
   time_period = c(1990,3000), centroids = TRUE)

## End(Not run)
```

---

get_range   *Create a species range map based on a get_gbif() output*

Description

Estimates species ranges based on occurrence data (GBIF or not) and ecoregions (may be an external, in-house or make_ecoregion() input). It first deletes outliers from the observation dataset and then creates a polygon (convex hull) with a user specified buffer around all the observations of one ecoregion. If there is only one observation in an ecoregion, a buffer around this point will be created. If all points in an ecoregion are on a line, the function will also create a buffer around these points, however, the buffer size increases with the number of points in the line. Finally, also note that in case of too many records, get_range can be used with a sub-sample of species observations to ensure a faster polygon process and/or to overcome potential RAM crash of the function.

Usage

```
get_range(
  sp_name = NULL,
  occ_coord = NULL,
  Bioreg = eco.earth,
  Bioreg_name = "ECO_NAME",
  degrees_outlier = 3,
  clustered_points_outlier = 2,
```

```
    buffer_width_point = 4,
    buffer_increment_point_line = 0.5,
    buffer_width_polygon = 4,
    dir_temp = paste0("temp", sample(1:99999999, 1)),
    raster = TRUE,
    res = 100
)
```

Arguments

sp_name	Character. Species name e.g., 'Anemone nemorosa'.
occ_coord	a get_gbif() output or a data.frame containing two columns named "decimalLongitude" and "decimalLatitude".
Bioreg	'SpatialPolygonsDataFrame', 'SpatVector' or 'sf' object containg different ecoregions (convex hulls will be classified on a bioreg basis) and of CRS WGS84. Note that this parameter may be fed with an external, generated (function make_ecoregion) or in-house ecoregion shapefile. Three in-house shapefiles are already included in the library: 'eco.earh' (for terrestrial species; Nature conservancy version adapted from Olson & al. 2001), 'eco.marine' (for marine species; Spalding & al. 2007, 2012) and 'eco.fresh' (for freshwater species; Abell & al. 2008). For marine species, eco.earth may also be used if the user wants to represent the terrestrial range of species that also partially settle on mainland. For fresh water species, same may be done if the user considers that terrestrial ecoregions should be more representtaive of the species ecology.
Bioreg_name	Character. How is the shapefile attribute containing the ecoregion names called? Default is the very detailed level of 'eco.earth' (aka 'ECO_NAME'). Note that 'EcoRegion' must always be used when using a make_ecoregion() output. See details.
degrees_outlier	
	Numeric. Distance threshold (degrees) for outlier classification. If the nearest minimal distance to the next point is larger than this threshold, it will be considered as an outlier.
clustered_points_outlier	
	Numeric. Maximum number of points which are closer to each other than the degrees_outlier, but should still be considered as outliers.
buffer_width_point	
	Numeric. Buffer (in degrees) which will be applied around single observations.
buffer_increment_point_line	
	Numeric. How much should the buffer be increased for each point on a line.
buffer_width_polygon	
	Numeric. Buffer (in degrees) which will be applied around distribution polygons (for each ecoregion).
dir_temp	Character. Where should the temporary text file for the convex hull be saved? (text file will be deleted again).
raster	Logical. Should the output be a unified raster? Default is TRUE
res	Numeric. If raster = TRUE, which resolution? Final resolution in ° = 1°/res e.g., = 0.1° (i.e. ~10km) if res = 10. Default is 100 (~1km). It is important to note that the highest achievable resolution of the output will depend on its 'Bioreg' precision, e.g., a species range output can reach the same resolution of the rasters used to create a 'make_ecoregion' object.

Details

Ecoregions cover relatively large areas of land or water, and contain characteristic, geographically distinct assemblages of natural communities sharing a large majority of species, dynamics, and environmental conditions. The biodiversity of flora, fauna and ecosystems that characterise an ecoregion tends to be distinct from that of other ecoregions (https://en.wikipedia.org/wiki/Ecoregion).

Each ecoregion shapefile has one or more categories, which describe more or less precisely the ecoregion world distribution (from the more to the less detailed):

- 'eco.earth' has three different levels: 'ECO_NAME', 'WWF_MHTNAM' and 'WWF_REALM2'.

- 'eco.fresh' has only one: 'FEOW_ID'.

- 'eco.marine' contains a mix of two types of marine ecoregions. Either common ('PROVINC' and 'REALM') or distinct levels:

—> For PPOW (Pelagic provinces of the world): 'BIOME'.

—> For MEOW (Marine ecoregions of the world): 'ECOREGION'.

Value

A 'SpatVector' or 'SpatRaster'.

Examples

```
## Not run:
# Load available ecoregions
data(ecoregions)

# First download the worldwide observations of Panthera tigris and convert to SpatialPoints
# get occurance points from GBIF
occ <- get_gbif("Panthera tigris",
      basis=c("OBSERVATION","HUMAN_OBSERVATION","MACHINE_OBSERVATION"))
# make range from occurance points
range <- get_range("Panthera tigris", occ ,eco.earth ,"ECO_NAME") #TODO change eco.earth to eco.land
## TODO download=TRUE by default, check presence of file.
# Plot
terra::plot(range, axes = FALSE, box = FALSE, legend=FALSE, col="chartreuse4")
# plot political world boundaries
terra::plot(rnaturalearth::ne_countries(returnclass = "sf")[1], add=T, col=NA)
graphics::points(occ[,c("decimalLongitude","decimalLatitude")],pch=20,col="#99340470",cex=1.5)

# plot(countries,col="#bcbddc")
# plot(ne_countries(returnclass = "sf")[4] , col="antiquewhite")
# TODO FIX THIS
# points(occ[,c("decimalLongitude","decimalLatitude")],pch=20,col="#99340470",cex=1.5)

## End(Not run)
```

---

get_status	*Retrieve from GBIF the IUCN and taxonomy status of a specific Taxa*

Description

Generates, based on a given species name, its IUCN red list status and a list of all scientific names (accepted, synonyms) found in the GBIF backbone taxonomy and used to download the data in get_gbif(). Children and related doubtful names not used to download the data may also be extracted.

Usage

```
get_status(
  sp_name = NULL,
  phylum = NULL,
  class = NULL,
  order = NULL,
  conf_match = 80,
  all = FALSE
)
```

Arguments

sp_name	Character. Species name from which the user wants to retrieve all existing GBIF names.
phylum	Character. Optional. What the species' Phylum? Adds a criteria to deal with alternative name matches and select the right synonym. Available options are the GBIF Phylums (listed per Kingdom –> https://www.gbif.org/species/1).
class	Character. Optional. What the species' Class? Same as above but at the finer class level. Available options are the GBIF Classes (same url).
order	Character. Optional. What the species' Order? Same as above but at the finer order level. Available options are the GBIF Orders (same url).
conf_match	Numeric. From 0 to 100. Determine the confidence threshold of match of 'sp_name' with the GBIF backbone taxonomy. Default is 90.
all	Logical. Default is FALSE. Should all species names be retrieved or only the accepted name and its synonyms?

Value

Data.frame with three columns: (1) GBIF taxonomic key, (2) scientificName and (3) Backbone Taxonomy Status, (4) Genus, (5) Family, (6) Order, (7) Phylum and (8) IUCN status

References

Chamberlain, S., Oldoni, D., & Waller, J. (2022). rgbif: interface to the global biodiversity information facility API. 10.5281/zenodo.6023735

Examples

```
get_status("Cypripedium calceolus",all=FALSE)
get_status("Cypripedium calceolus",all=TRUE)
```

make_ecoregion	*Make an ecoregion map based on input environmental variables*

Description

This function may be used if the in-house ecoregion shapefiles are too coarse for a given geographic region (e.g., for local studies) or a shapefile of finer environmental details is needed. Based on several environmental layers (e.g. climate, soil and land cover), this function can generate a map of environmental regions containing n categories/classes. The classes are calculated with the 'clustering large applications' method (CLARA), which recognize patterns and relationships existing in spatial data, and classify it in clusters.

Usage

```
make_ecoregion(
  env = NULL,
  nclass = NULL,
  path = "",
  name = "",
  raster = FALSE,
  ...
)
```

Arguments

env	Object of class SpatRaster, RasterBrick or RasterStack of desired resolution, crs and extent defining the study area. Used to generate a map of clusters summarizing the environmental space of the study area.
nclass	Numeric, How many number of environmental classes should have the output?
path	Character. Folder path where the output should be saved. Default is none.
name	Character. If 'path' is used, should include the name of the output file (without file extension)
raster	Logical. Whether the output should be a raster layer. Default is FALSE.
...	Additonnal parameters for the function clara() of the clutser R package.

Value

A TIFF or SHP file

rst <- terra::rast(rst.path)
shp.path <- paste0(system.file(package = "gbif.range"),"/extdata/shp_lonlat.shp")
shp.lonlat <- terra::vect(shp.path)
rst <- terra::crop(rst, shp.lonlat)
#plot(crp)

# Apply the function by infering 50 classes of environments
my.eco <- make_ecoregion(rst,50)
terra::plot(my.eco)

# Downloading in the European Alps the observations of one plant species
obs.arcto <- get_gbif("Arctostaphylos alpinus",geo=shp.lonlat)

# Create the range map based on our custom ecoregion
range.arcto <- get_range("Arctostaphylos alpinus",obs.arcto,my.eco,"EcoRegion",res=20)

# Plot
terra::plot(shp.lonlat, col="grey")
terra::plot(range.arcto,add=TRUE,col=rgb(0.2,1,0.2,0.5,1))
graphics::points(obs.arcto[,c("decimalLongitude","decimalLatitude")],pch=20,col="orange1",cex=1)
```

---

make_tiles	*Create a specific number of tiles based on a raster extent*

Description

Based on a specific extent, one or several tiles are generated. Tiles can be smaller raster extents or geometry arguments POLYGON(). The original extent is therefore either converted into a POLYGON() argument, or divided into Ntiles of regular fragments which are converted into POLYGON() arguments and smaller SpatExtent.

Usage

```
make_tiles(geo, Ntiles, sext = TRUE)
```

Arguments

geo	Object of class Extent, SpatExtent, SpatialPolygon, SpatialPolygonDataframe, or SpaVector (WGS84 or planar) to define the study's area extent. Default is NULL i.e. the whole globe.
Ntiles	Numeric. In how many tiles/fragments should geo be divided approximately?
sext	Logical. Should a list of SpatExtent also be returned for each generated POLYGON()?

Value

A list of geometry arguments POLYGON() of length Ntiles (and of SpatExtent if sext=TRUE).

Examples

```
# Load the European Alps Extent
shp.path <- paste0(system.file(package = "gbif.range"),"/extdata/shp_lonlat.shp")
shp.lonlat <- terra::vect(shp.path)

# Apply the function to divide the extent in ~20 fragments
mt = make_tiles(geo=shp.lonlat,Ntiles=20,sext=TRUE); mt
```

---

obs_filter   *Filter a set of GBIF observations according to a defined grain*

Description

Whereas the 'grain' parameter in get_gbif() allows GBIF observations to be filtered according to a certain spatial precision, obs_filter() accepts as input a get_gbif() output (one or several species) and filter the observations according to a given grid resolution (one observation per pixel grid kept). This function allows the user to refine the density of GBIF observations according to a defined analysis/study's resolution.

Usage

```
obs_filter(gbifs, grid)
```

Arguments

gbifs	One get_gbif() output including one or several species. Note that if GBIF absences are kept in the output(s), the function should be used distinctively for observations and absences.
grid	Object of class SpatRaster, RasterLayer, RasterBrick or RasterStack of desired resolution and extent (WGS84).

Value

Data frame with two columns named 'x' and 'y' comprising the new set of observations filtered at grid resolution.

Examples

```
#read example shapefile
shp.path <- paste0(system.file(package = "gbif.range"),"/extdata/shp_lonlat.shp")
shp.lonlat <- terra::vect(shp.path)
rst.path <- paste0(system.file(package = "gbif.range"),"/extdata/rst_enl.tif")
rst <- terra::rast(rst.path)

# Downloading in the European Alps the observations of two plant species
obs.arcto <- get_gbif("Arctostaphylos alpinus",geo=shp.lonlat)
obs.saxi <- get_gbif("Saxifraga cernua",geo=shp.lonlat)
terra::plot(shp.lonlat)
graphics::points(obs.arcto[,c("decimalLongitude","decimalLatitude")],pch=20,col="#238b4550",cex=1)
graphics::points(obs.saxi[,c("decimalLongitude","decimalLatitude")],pch=20,col="#99000d50",cex=1)

# rbind both datasets
both.sp <- rbind(obs.arcto,obs.saxi)

# Run function
obs.filt <- obs_filter(both.sp,rst)

# Check new points
terra::plot(shp.lonlat)

graphics::points(obs.filt[obs.filt$Species%in%"Arctostaphylos alpinus",c("x","y")],
pch=20,col="#238b4550",cex=1)

graphics::points(obs.filt[obs.filt$Species%in%"Saxifraga cernua",c("x","y")],
pch=20,col="#99000d50",cex=1)
```
